Windows side: Drive, Notepad ++, PM app, Github via web
Ubuntu side: notepad, github via terminal, filetree
• I want notes in PM (or referenced), saved in local
filetree, and synced w/ Github. I guess I don't
need redundant PM for accessing files, if I
also have them in relevant folder(s) in
filetree, and also in github. So I should
practice to see if I can sync files via web
on Windows side, and then also practice
git pull on Ubuntu side.

• The biggest piece that's still missing is
diagramming. And that definitely blows ⊕ it
can't be in-line. But that seems to be a
worthy point with the level ⊕ software
is currently at, and I suppose I'll just
have to live w/ ⊕ for now. I could just
make separate diagram files for now,
or I could eliminate ⊕ consideration at
this time and continue diagramming
on paper. The frustrating part is that
I often diagram in line w/ other thought
digestions, and it's arbitrary to have
two separate spaces for one line of
thought. I could draw/write on Notell
or via Wacom tablet/Xournal app →
⊕ would just require one extra layer
of software which is def. wonky.
Or I could snap photos of diagram
and save on compn... But I suppose
if digital notetaking were as easy as
analog, then everyone would be
doing it. And I suppose I'm just
frustrated ⊕ it's taking so long, given
where we're at! Too bad I can't just
whip out a solution over the
weekend...
• But I digress...!
